                                                                                                                                                                                                                                                                                                                                                          in the concentration of the index substance during the incubation is detected to judge the presence of appptosis inhibition or apoptosis promotion. The apoptosis inhibitor or the apoptosis promoter can be used as a drug and a diagnostic agent for various diseases caused by apoptosis inhibition or apoptosis promotion. The present sequence represents the human Bcl-2 protein, which is an apoptosis inhibitor used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for screening for an apoptosis inhibitor or an apoptosis promoter in which VDAC-liposome, an index substance which can pass VDAC and a sample are incubated and the change

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The 80-6 mutant (AAW01020) of the bcl-2 oncogene product (AAW01018) lacks amino acids 80-86 of the native protein. This and other Bcl-2 mutants (see also AAW01019-21) were used in a two hybrid assay to examine the interactions between Bcl-2 and novel apoptosis-regulating proteins Nipl, Nip2 and Nip3 (AAW00997-99), 2 Motifs (AAW01003-04) on Bcl-2 were identified that are essential for interaction with the Nip proteins. These motifs show homology to motifs (AAW01005-06) identified on the adenovirus E1B 19K
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Apoptosis-regulating protein; Bcl-2; oncogene; adenovirus E1B 19K protein; cell death; cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     interaction with the Nip proteins. These motifs show to motifs (AAW01005-06) identified on the adenovirus apoptosis-blocking protein (AAW01010).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding apoptosis regulating proteins - useful diagnosing and treating immune disorders, malignancies, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               В
                                                                                                                                                                                                                   The present invention describes: (1) a method for regulating cell death, comprising exposing an isolated cell to a polypeptide selected from Nip1, Nip2, Nip3, Bip1A, Bip5 and Bip13; (2) a method for neutralising the activity of the adenovirus E1B 19 kD protein, the Bcl.-2 protein or the BHRF-1 protein, comprising exposing an isolated cell to a polypeptide as in (1); and (3) a method for detecting molecules that bind to at least one polypeptide as in (1), comprising lysing cells, capposing the lysate to the polypeptide and detecting any molecule-polypeptide aggregates. The methods are useful for providing proteins polypeptide aggregates. The methods are useful for providing proteins able to bind to other proteins known to regulate cell survival e.g. it is known that E1B 19K protein provides a survival function similar to the cellular protonocogene bcl-2 gene product which is able to block apoptosis in haematopoietic B and T cells. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW87811
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 14
                                                                                                                                                           designated Bax. The Bax protein is used in a composition which comprises a bel-2 family member polypeptide, a naturally occurring Bax polypeptide and an antibody that binds to the Bax polypeptide. The specification also describes a composition comprising a hybrid protein comprising an activator domain of a transcriptional activator protein and a bel-2 family member having a BHI domain and a BH2 domain another hybrid protein comprising a DNA-binding domain of the transcriptional activator protein and a second bel-2 family member having a BHI domain and a BH2 domain; and a reporter gene linked to a transcriptional regulatory element whose transcriptional activity is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10-NOV-1994;
26-AUG-1993;
25-MAY-1994;
                                            of the two bcl-2 family members. The compositions are used to identify modulators of bcl-2-related function, e.g. substances that inhibit binding of Bax to bcl-2, which would be potentially useful as drugs
                                                                                             dependent on the presence or absence of a dimer of the two hybrid proteins. The bcl-2 family members are selected from naturally occurring Bcl-2, Bcl-xL, Bax, Mcl-1, Al, fragments thereof, and mutants having a mutation in the BHI and/or BH2 domain that alters intermolecular binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1999-105119/09
                                                                                                                                                                                                                                                                                                                               The present sequence represents a murine Bcl-2 protein specification also describes Bcl-2 associated proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ъ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δõ
                                                                                                                      The present invention relates to a method of modulating apoptosis of a cell. The method comprises administrating to the cell an agent, comprising a BHI domain or BH2 domain, capable of modulating formation o at least one complex selected from bcl-2:bcl-2 complexes, bcl-XL:bcl-XL complexes, bcl-2:associated X protein (Bax):Bax complexes, bcl-2:Bax complexes or bcl-XL:Bax complexes Modulating apoptosis is especially useful in cancer therapy, and treating autoimmunity, immunodeficiency diseases (e.g. AIDS), reperfusion injury, myocardial infarction, stroke, traumatic brain injury, neurodegenerative diseases, aging, ischaemia, toxemia, infection, hepatitis, transplant rejection, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          10-NOV-1994;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Forms homodimers, and heterodimers with BAX, BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity).  FUNDECLIULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum. FISSUE SPECIFICITY: Expressed in a variety of tissues, with highest levels in reproductive tissues. In the adult brain, expression is localized in mitral cells of the olfactory bulb, granule and pyramidal neurons of hippocampus, pontine nuclei, cerebellar granule neurons, and in ependymal cells. In prenatal	SEQUENCE OF 19-172 FROM N.A.  REDLINE-95059917; PubMed=7969891;  Castren E., Ohga Y., Berzaghi M.P., Tzimagiorgis G., Thoenen H.,  Lindholm D.;  "bcl-2 messenger RNA is localized in neurons of the developing and adult rat brain.";  "bcl-2 messenger RNA is localized in neurons of the developing and adult rat brain.";  "bcl-2 messenger RNA is localized in neurons of the developing and adult rat brain.";  "bcl-2 messenger RNA is localized in neurons of cell systems including factor-dependent lymphohematopoietic and neural cells.  "including factor-dependent lymphohematopoietic and neural cells.  Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAR-1).	SEQUENCE FROM N.A.  SEQUENCE FROM N.A. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bc12 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               L14680; AAA53662.1;

Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases. Dephosphorylated by protein phosphatase 2A (PP2A) (By similarity). PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             promoting further caspase activity.
DISEASE: Involved in follicular lymphoma (FL) (also known as type
II chronic lymphatic leukemia) by a chromosomal translocation
II chronic lymphatic leukemia) by a chromosomal translocation
L(14;18)(q32;q21) which involves Bcl2 and immunoglobulin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         are produced by alternative splicing. TISSUE SPECIFICITY: Expressed in a vari DOMAIN: The BH4 domain is required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (BY similarity). Also interacts with APAF-1 and RAF-1. SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum. ALTERNATIVE PRODUCTS: 2 isoforms; alpha (shown here) and beta;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 www-"http://www.infobiogen.fr/services/chromcancer/Genes/BCL2ID49.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for interaction with RAF-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAF-1) (By similarity). SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BHI and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCELIULAR LOCATION: Outer mitochondrial membrane, intracellular and the february of the substance of the s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle (By similarity). In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases (By similarity). Dephosphorylated by protein phosphorylated by similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                membrane of the nuclear envelope and the endoplasmic reticulum.

DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and ARF-1 (By similarity) SUBCELLULAR LOCATION: Outer mitcobondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the apoptosis-activating factor (APAF-1) (By similarity). SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the

membrane of the nuclear ALTERNATIVE PRODUCTS: 2

LOCATION: Outer mitochondrial membrane, intracellular the nuclear envelope and the endoplasmic reticulum. PRODUCTS: 2 isoforms; alpha (shown here) and beta;

SUBCELLULAR

are produced by alternative splicing. TISSUE SPECIFICITY: Expressed in a va

DOMAIN: The BH4 domain

interaction with

-!- PTM: Proteolytically cleaved by caspases during apoptosis.
cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytos promoting further caspase activity.
-!- SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.
-!- SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.
-!- SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.
-!- SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 4 (BH4) DOMAIN.
-!- SIMILARITY: BELONGS TO THE BCL-2 FAMILY.

cytosol

The

protein

anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bc12 appears to be phosphorylated by other protein kinases, such as ERKs and stress-activated kinases.

Dephosphorylated by protein phosphatase 2A (PP2A).

PTM: Phosphorylation/dephosphorylation on Ser-70

RAF-1

required

for

anti-apoptotic

activity and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4
FUNCTION: Potent inhibitor of cell death. Inhibits activation caspases (By Similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by bindit of it and preventing the release of the caspase activator,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IQENGGW
